

1.7 and Beyond

TortoiseSVN

- The SVN client on Windows
- Integrated into Explorer
- Indicate w/c state as overlay
- Accessible from any application
- Exceeds basic SVN functionality
- Extensive documentation
- Available in > 30 languages

- 22 months of development
- 4159 commits (1868 src, 2291 doc and others)
- 48 new features
- 16 feature improvements
- 2 unreleased bug fixes
- 116 bug fixes and 16 other changes released in 1.6.x

(statistics as of 2010-01-05, revision 20666)

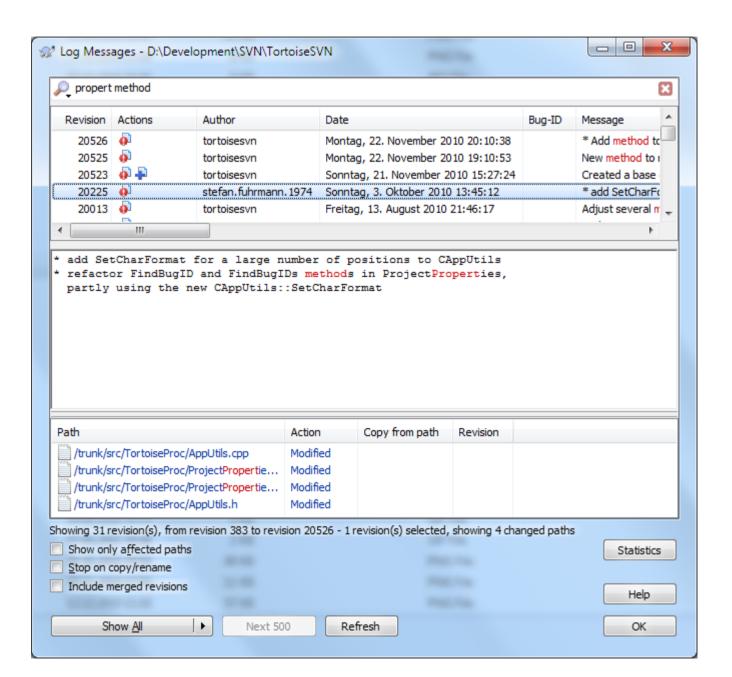

- Full SVN 1.7 feature support
- Log dialog
 - fast even for > 1 million revs
 - search-engine-like complex filter
 - highlight matching strings
 - multi-select displays shortened summary of messages
 - revisions mentioned in messages are turned into links
 - export of changed items

Log Dialog Demo

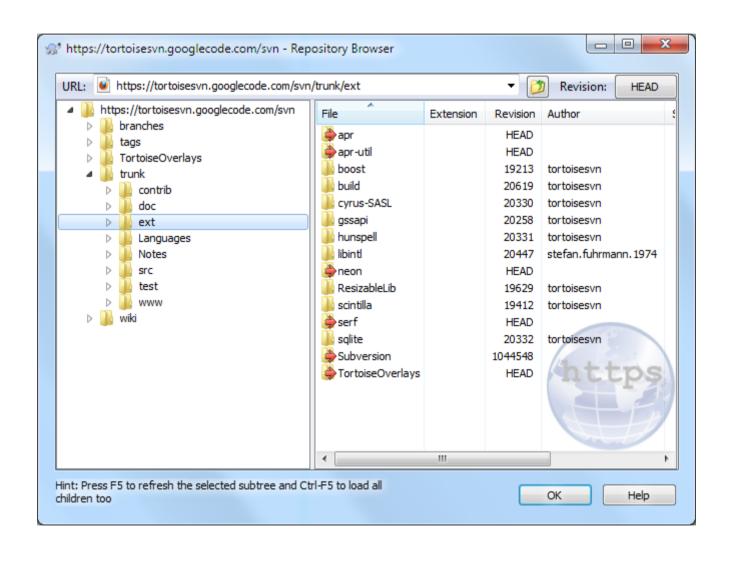

- OS support
 - Windows 7 Aero look and libraries
 - 64 bit installer also includes support for 32 bit applications
- Repository browser
 - shows syn:externals as sub-trees
 - edit files directly
 - drag to explorer to create an URL link
 - pre-fetch sub-folder content using parallel queries

Repository Browser Demo

- Adjusting externals to a fixed revision when branching or tagging
- Check-out dialog supports single files and multi-select
- New dialog for sparse checkouts
- Offer automatic update and retry if a commit failed due to an outdated working copy
- More command line options
- TortoiseUDiff can operate from stdin ("pipe")

- Custom dialogs to edit specific properties
- New, particularly small, overlay icon set
- Option only to add the TSVN menu items for SVN w/cs
- URL handler for TSVN commands
- Various small improvements all over the place, e.g. TMerge
- More general feature availability

- Further SVN speedup allows for pre-fetching logs and w/c data
- Off-line commits open a whole new world of possibilities
- New client-side features, e.g. partial file commits
- Streamline workflows
 - Reduce clicks and UI complexity
 - Re-use information like last URLs everywhere
 - Display repository content inside the Explorer

- Aim-like application fed from TSVN and user-defined agents
- Inform user on various events and suggest SVN actions
 - Check-in by other user
 - Detect [potential] conflicts and required updates
 - User-defined checks on properties
 - Suggest commits
- Accept / reject / postpone suggested actions with a single click

- SVN can be the fastest and most powerful SCM system
 - Servers can afford for expensive HW and optimizations
 - Cascading repository setups (i.e. DVCS) feasible
 - C/S architectures tend to handle multi-core clients better
- Maybe, learn the difference between content and containers
 - Users modify code and documents (content)
 - Most SCM systems manage files (containers)
 - Mismatch makes changes like refactoring hard
